CLASSIFICATION AND CODING INSTRUCTIONS

FOR LIVE BIRTH RECORDS, 1985

SECTION I - INTRODUCTION

This manual provides data preparation instructions for use by the National Center for Health Statistics (NCHS) in processing basic statistical source data from microfilm (or paper) copies of certificates of birth events occurring in 1985 (see Illustration 1 for "U.S. Standard Certificate of Live Birth"). To assure data convertibility, the code structures and coding instructions are also used by the states that provide precoded data through the vital statistics cooperative program.

SECTION II - BACKGROUND

Microfilm (or paper) copies or state-coded data tapes of birth certificates are received from the vital statistics office of each state and the possessions. All reporting areas transmit 100 percent of their birth records to NCHS in one of these forms. All of the records are used from states that supply state-coded data tapes. For states submitting microfilm (or paper) copies of their birth records, NCHS codes and processes a fifty percent sample of the source records.

As shipments of the microfilm (or paper) copies of birth records are received, the records are typically batched into lots of work containing 2,000-3,999 sample records for processing efficiency. Each lot may consist of one or more data months from one or registration areas. The lots, accompanied by a Lot Control Record (see Illustration 2), are then assigned to key entry operators to classify and convert the data into machine readable form. As each lot is completed and appropriate entries are made on the control records, the source records and control records are returned to the control clerk.

A statistical data record containing demographic data is prepared for each source record designated by the applicable sampling procedure. Additionally, for those source records identified during demographic preparation as having selected information on congenital anomalies, a separate medical data record is created. In this medical data record, codes are assigned by nosologists to those congenital anomalies which are classifiable in the Ninth Revision of the International Classification of Diseases (ICD). After verification procedures and initial mechanical edits are completed, the demographic and medical records are merged for statistical tabulations.

In the coding operation, considerable variation is encountered both in certificate format and in the manner of reporting required data. Coding aids such as special rules, atlases, guides in the use of state-entered codes, and problem referral procedures are available to facilitate proper interpretation.

SECTION III - GENERAL INSTRUCTIONS

A. Sampling Procedures

The general sampling procedure calls for data preparation of a 50 percent sample of live birth records with the exception of Guam and the Virgin Islands whose records are 100 percent processed. The sample records are those with record numbers terminating in an even digit. In addition, birth records of events occurring in the U. S. which have file numbers terminating in an odd digit are processed if such "odd numbered" records are "Indian events." An "Indian event" is defined as a record on which the race of father and/or race of mother would be coded as "Indian" (code 3) according to the instructions given in Section VIII of this manual.1/

B. Additional and Corrected Information

Additional or corrected information for an item(s) on specific birth source records may be microfilmed either preceding or following the record to which it relates. The corrected or additional information for specific items is coded from these corrected records. Also, corrected source records may be received separate from the original record. In such cases, these amended records will be appended to the Lot Control Record if received prior to assignment for processing. Amendments received after initial assignment are not processed.

C. Duplicate and Unnumbered Records

The birth number and state code are used in matching the demographic data record and corresponding medical data record. To avoid mismatches among data records with duplicate record numbers or no numbers, enter as follows:

1. Duplicate Record Number

For duplicate birth numbers assigned to different events, code and enter each odd or even numbered record. Enter the birth number as it appears for the first record; enter 99 for the first two digits of the birth number of the second duplicate number record, 98 for the third such number, 97 for the fourth, 96 for the fifth, 95 for the sixth, 94 for the seventh, 93 for the eighth, 92 for the ninth, 91 for the tenth, 90 for the eleventh, 89 for the twelfth, etc., for all subsequent records having duplicate birth numbers. Record each duplicate birth number in the appropriate block of Section II of the Lot Control Record.

1/ "Odd numbered Indian events" are processed for the Indian Health Survey under a reimbursable agreement.

SECTION III - GENERAL INSTRUCTIONS - continued

C. Duplicate and Unnumbered Records - continued

2. Unnumbered source records will be assigned the same birth number as that of the preceding source record when the preceding number terminates in an even digit except 99 is to be substituted as the first two digits of the birth number. Continue altering the first two digits of the birth number in descending order 98, 97, 96, etc., for all subsequent unnumbered records.

D. Repeated Records

When more than one source record appears for the same event (record), enter one record only. No entry is required on the Lot Control Record.

E. Records Voided or Cancelled on Film

Write the birth number of any voided/cancelled records ending in an even digit in the appropriate block in Section II of the Lot Control Record.

F. Deletions

Do not enter data for events that occurred out of the data year. Do not enter data for duplicate event(s), different number(s). Write the birth number of any such records in the appropriate block in Section II of the Lot Control Record.

G. Filmed Behind Wrong County Target (For states where records are ordered by county before numbering)

If a record has been filmed behind the wrong county target, enter the correct county code and write the birth number in the appropriate block in Section II of the Lot Control Record.

H. Overlapping Records; Missing, Illegible Records or Entries

1. Missing or Illegible Records

If more than four items cannot be determined, consider the record illegible. Write the birth number of each missing or illegible sample record in Section II of the Lot Control Record.

NOTE: Entries on the Lot Control Record are essential in reconciling data/checklist counts and/or requesting retakes; therefore, entries must be recorded accurately and posted to the appropriate category.

SECTION III - GENERAL INSTRUCTIONS - continued

H. Overlapping Records; Missing, Illegible Records or Entries - continued

2. Illegible Item

If an item is illegible, assign the code for the "unknown" category to that item and enter the remainder of the data on that record.

3. Overlapping Records

If more than four items cannot be determined because of overlapping records on microfilm consider the record illegible and write the birth number(s) in Section II of the Lot Control Record.

SECTION IV - SPECIAL RULES

A. Development of Special Rules

At the beginning of a data year, a sample of source records for each registration area is inspected by the supervisor to identify items and reporting characteristics that depart from the general reporting practices covered by this manual. Decisions are made on these items and special instructions are developed.

B. Use of Special Rules

When a unit of work is assigned, the coder is also given a copy of special rules for each registration area represented in the work unit. The coder is to become fully familiar with the special rules, resolving any question with the supervisor before starting to work on the unit. Special rules are to take precedence over the instructions in this manual in any case when the two can be interpreted as contradictory.

SECTION V - REFERRAL OF PROBLEMS

A coder encounters various questions and uncertainties in the course of the work. The types of problems are as follows:

A. Coding problems stemming from inadequate instructions or from the coder's inability to apply the instructions.

B. Legibility problems.

The referral form given in Illustration 3 is to be used for problems in Group A. Records with problems falling into Group A are to be coded to the best ability of the coder. The referrals containing questions that could apply to all coders are discussed by the supervisor in periodic group meetings so all coders may benefit. Those referrals that indicate individual coder inability are discussed privately with the coder.

SECTION V - REFERRAL OF PROBLEMS - continued

Coders are to resolve all problems in Group B without supervisory assistance. If the coder cannot determine the entry, the code for the "unknown" category of that item should be assigned.

SECTION VI - VERIFICATION PROCEDURES

A. General

Independent verification will be performed only on the even numbered live birth records. The odd numbered birth records, which are prepared for the Indian Health Survey, will not be verified. In the independent verification process, the verification operator duplicates the operation of the entry clerk by reentering the information from the source document following the same sequence as that executed by the entry operator. The verification operator is to satisfy discrepancies on the basis of the information appearing on the source document without influence of the coder.

Verification will be carried out under either a total or sample verification scheme as specified in the following paragraphs.

B. Total Verification

1. All work units consisting of less than 2,000 sample (even numbered) records will be 100 percent verified.

2. All work units processed by entry operators not qualified for sample verification will be 100 percent verified.

C. Sample Verification

Ten percent sample verification will be employed on all work lots containing 2,000-3,999 sample records which are processed by an entry operator who has achieved and maintained the level of accuracy prescribed in this section.

1. Criteria for Sample Verification Qualification

Processing of successive work lots totaling 6,000 sample records or more at a record error rate of 2.5 percent or less will constitute qualification for sample verification of subsequent work lots.

2. Sample Selection

Determination of the sample of certificates to be verified in each work lot is carried out as follows:

a. Using a table of random numbers, select an even number within the range of 00-18.

Example: 12

SECTION VI - VERIFICATION PROCEDURES - continued

C. Sample Verification - continued

2. Sample Selection - continued

b. Add 20, 40, 60, and 80 to this number thus creating four additional two-digit numbers.

Example: 12, 32, 52, 72, 92.

c. Verify each certificate in the work lot for which the last two digits of the certificate number correspond to one of the five selected numbers.

Example: In a lot which begins with certificate number 001050 and the above five sample numbers are selected, one would verify the following certificate numbers: 001052, 001072, 001092, 001112, 001132, 001152, 001172, 001192, 001212, 001232, etc.

3. Allowable Error

The allowable error is the number of sample records in error which may be present in a work lot before the verifier must discontinue sample verification and verify the remainder of the lot on a 100 percent basis.

If the allowable error for a work lot is 8, sample verification would terminate with the ninth error record. The remaining records in that lot will then be verified 100 percent.

The following are allowable errors for work lots of specified sample record volume:

Number Data Records	Number Data Records for Sample Verification	Allowable Error
2,000-2,249	200-224	8
2,250-2,499	225-249	9
2,500-2,749	250-274	10
2,750-2,999	275-299	11
3,000-3,249	300-324	12
3,250-3,499	325-349	13
3,500-3,749	350-374	14
3,750-3,999	375-399	15

The allowable error will be entered on the Lot Control Record by the control clerk.

SECTION VI - VERIFICATION PROCEDURES - continued

C. Sample Verification - continued

3. Allowable Error - continued

If during the sample verification of records processed by an individual entry operator the allowable error is exceeded, the entry operator is removed from sample verification and all of his/her subsequent work lots are verified 100 percent until he/she requalifies for sample verification by meeting the criteria specified above.

SECTION VII - DATA ENTRY EQUIPMENT

Key to disc processing is the primary mode of vital record demographic data entry. In key to disc processing, data are keyboarded directly into a mini computer. Interactive with key entry, the computer software performs valid code field edits and selected interfield dependency edits where applicable. The results of the edits are displayed on a cathode ray tube for immediate resolution by the key entry operator or referral to the supervisor if necessary. Other features of the key to disc entry equipment include capabilities for automatic display of data as keyed, key and sight verification, in place record insertion and deletion, and file searches. Since these functions are common to the use of the equipment on any data type, they are contained in a separate operator's reference manual provided by the vendor. This instruction manual contains only those formats and edit specifications unique to key to disc entry of 1985 live birth data (see Section VIII).

SECTION VIII - INSTRUCTIONS FOR DATA CLASSIFICATION AND MACHINE ENTRY

This section contains the data entry, code structure, and classification instructions (excluding special rules) which a coding clerk is to follow in processing each item on the birth certificate. Also included are the edit specifications which are programmed into the key to disc system and to which the coder may have to react based on cathode ray tube screen prompts. The input format and positions are specific to the brand of key to disc equipment used by the Data Preparation Branch of the NCHS. The output format and positions are common to any data entry equipment. Accordingly, where other key to disc, card, or tape equipment is employed, the input procedure may change. The data record output tape positions, however, would not change.

SECTION VIII - DATA CLASSIFICATION AND MACHINE ENTRY - continued

ITEM	KEY TO DISC INPUT		CODE STRUCTURE	CODING INSTRUCTIONS
	PROGRAM LEVEL	DATA POSITION		
DATA YEAR	2*	1	5	Format generated "5."
SHIPMENT NUMBER	2	2-3	01-09	Enter for duplication.
PLACE OF BIRTH STATE	2	4-5	01-54	Enter for duplication in output record. See Appendix A for state codes.
BIRTH NUMBER	3**	1-6		
SEX	3	7	Male----------1 Female---------2 Undeterminable or not stated--9	If sex is not clearly identified, code from name. If name does not establish sex clearly, code 9
DATE OF BIRTH	3			
Month		8-9	January-------01 February------02 March---------03 April---------04 May-----------05 June----------06 July----------07 August--------08 September-----09 October-------10 November------11 December------12 Unknown or not stated--------99	
Day		10-11	01-31 Unknown or not stated--------99	

* Program level 2 records must be created when beginning a new state or a new batch. For each program level 2 record, the system is programmed to duplicate its entries into the output tape records until another program level 2 record is encountered.

** Program level 3 records must be created for entering the detail non-repetitive data.

ITEM	KEY TO DISC INPUT PROGRAM LEVEL	KEY TO DISC INPUT DATA POSITION	CODE STRUCTURE	CODING INSTRUCTIONS
RESIDENCE OF MOTHER	3			Ignore the name of a state, county, or city entered on the address line when an entry is reported in the spaces provided for these items.
State		21-22	01-57, 59	When the state, county, or city entry has obviously been typed on the incorrect line, consider the entry when classifying residence.
County		23-25	001-954 Select code from Section I, Vital Statistics Instruction Manual - Geographic Codes, January 1982. Select code from Section II only when record contains no county entry.	When North, East, South, or West is given with a city entry, and it is not listed this way in Section I or II, check the atlas to determine if it is a separate geographic place or an inclusion of the named city. If the named place is not listed in the atlas, consider the entry to be an inclusion of the city named (e.g., East Durham is not listed in the atlas and therefore, is considered to be an inclusion of the city of Durham). If county is given and two cities are given on the city line, check atlas to determine if one is an inclusion. If not, code to city with the larger population. If no county entry is reported and the city is not listed in the Vital Statistics Instruction Manual - Geographic Codes, January 1982, Section II, refer to the atlas to determine county. If atlas indicates city is listed in two counties, refer to the U. S. Census Population 1980, "Number of Inhabitants" and code to the county containing the largest part of the city's population. If New York City is given as place of residence and no borough is given, code to Manhattan Boro.

KEY TO DISC INTERACTIVE EDITS	OUTPUT TAPE POSITION
Integer field. Must enter	
Range: 01-57, 59.	26-27

RACE OF MOTHER	3	28	White (includes Mexican, Puerto Rican, other Hispanic, and all other Caucasian ---- 1 Black -------- 2 Indian (American Alaskan, Canadian, or Mexican Indian, Eskimo and Aleut) ------- 3 Chinese ------ 4 Japanese ----- 5 Hawaiian (includes part Hawaiian) ---- 6 Other nonwhite (includes Cajun and Creole) -- 7 Filipino ----- 8 Other Asian or Pacific Islander ----- 0 Unknown, not stated, or not classifiable - 9	See Appendix E for other race entries on records. See Appendix F for names of Indian tribes in the U.S., Canada and Mexico. 1. If a mixture of Hawaiian and any other race, code Hawaiian. 2. If a mixture of white and any other race, code to the appropriate nonwhite race. 3. If a mixture of nonwhite races (except Hawaiian), code the first race listed. 4. If entry is "Col.," "N," "Negro," "Colored," "B," "Brown," "A.A.," or "Afro-American," consider the race as Black. 5. If the racial entry is "Yellow," "Oriental," or "Mongolian," and birthplace is given as China, Japan, or the Philippines, consider the parent as belonging to the race indicated by this information. If birthplace is <u>not</u> China, Japan, or the Philippines, consider the parent's race "other Asian or Pacific Islander." 6. If racial entry is "Indian" and birthplace is <u>not</u> in the United States (including Alaska), Canada (any of the provinces), or Mexico, consider race as "Other Asian or Pacific Islander." 7. If "part _____," "1/4, 1/2, 3/4 ____" is given as a single race entry, code the reported race ignoring the prefix.
RACE OF FATHER		29

SECTION IX - PREPARATION OF MEDICAL RECORD

Part A. Medical Coding Instructions

Birth records containing a stated congenital malformation will be flagged by the Vital Records Section, Demographic Coding Unit, with a code 1 in data position 71. Flagged records will be listed to minimize time required for locating selected records for medical coding. From this listing, a medical record is to be generated for each record reporting a congenital condition classifiable in the International Classification of Diseases, Ninth Revision. Conditions are to be coded on the computer listing in the order that they appear on the record. When more than seven codable conditions are encountered, delete duplicate codes. If more than seven remain, refer to supervisor.

Only the information recorded in the space provided for congenital malformations is to be considered for coding purposes.

All coding is to the full four-digit code level. The medical coding is dependently verified on a 100 percent basis. After medical coding, the data are key entered and 100 percent verified on key to disc equipment according to the format and instructions given in Part B of this section.

Part B. Data Classification and Machine Entry for Medical Data Records

ITEM	KEY TO DISC INPUT PROGRAM LEVEL	KEY TO DISC INPUT DATA POSITION	CODE STRUCTURE	CODING INSTRUCTIONS
DATA YEAR	2*	1	5	Format generated "5"
STATE OF BIRTH	2	2-3	01-51	Enter for duplication in output record. See Appendix A for state codes.
COMPONENT OF REPORTING AREA	2	4	Chicago--------6 New York City Boroughs: Bronx--------1 Brooklyn-----2 Manhattan----3 Queens-------4 Richmond-----5 All other reporting areas ----------0	Enter for duplication in output record.
BIRTH NUMBER	3**	1-6		
CONGENITAL MALFORMATIONS	3	7-10 11-14 15-18 19-22 23-26 27-30 31-34		1. Enter each condition code in the order it appears on the computer listing. 2. Fields are to be left blank when no code is recorded on computer listing. 3. For three-digit codes, (a) ignore "X's" when recorded with a three-digit code and (b) leave data positions 10, 14, 18, 22, 26, 30, and 34 blank.
END OF RECORD				

* Program level 2 records must be created when beginning a new state or a new batch. For each program level 2 record, the system is programmed to duplicate its entries into the output tape records until another program level 2 record is encountered.

** Program level 3 records must be created for entering the detail non-repetitive data.

SECTION X - PROCEDURES FOR CHECKLIST/DATA COUNT RECONCILIATION AND REJECT PROCESSING

A. Checklist/Data Count Reconciliation

1. For States Submitting Certificates Numbered Behind County Targets

A checklist control form accompanies the transmittal of source records to NCHS from each registration area. This form provides counts of source records by county of occurrence for each month submitted. Once keyed to tape, it is used as a control against which the data record file can be balanced down to the level of county of occurrence. Counts for data checklist files are compared by computer, and the following listings are produced to enable proper balancing.

a. Table 3 - Monthly Verified Count by State and County

General

This table is produced for each computer processing cycle. The 100 percent count obtained from the data records for each county or county equivalent, is compared with the corresponding checklist count. Any difference between the two is printed out in the column labeled "Difference Count." A minus difference indicates that the DATA COUNT is that much LESS than the checklist count. A positive difference indicates that the DATA COUNT is that much MORE than the checklist count. (The actual number of records involved is one-half that of the Difference Count.)

NOTE: The beginning and ending birth numbers shown for each county are not necessarily inclusive. Refer to the Analysis Listing for specific range of birth numbers contained in each county.

Sequence

State of occurrence and county (or county equivalent).

b. Data Analysis Listing

General

This listing is produced from the natality tapes by cycles representing approximately 160,000 records each. It is to be used in reconciling the data counts with checklist counts when the difference is over the allowable tolerance.

SECTION X - PROCEDURES FOR CHECKLIST/DATA COUNT RECONCILIATION AND REJECT PROCESSING - continued

A. Checklist/Data Count Reconciliation - continued

1. For States Submitting Certificates Numbered Behind County Targets - continued

b. Data Analysis Listing - continued

Sequence

The listing is in sequence by state of occurrence, county (or county equivalent), and birth number.

Explanation

For each county or county equivalent, the following information is printed out:

(1) The birth number of the FIRST record (START).

(2) The birth number of the LAST record (END).

(3) The numbers of any sample records that are missing between the first and last birth numbers shown. (Individual numbers are printed if only one record is missing; an inclusive group is shown when any consecutive numbers is missing.)

(4) The odd numbered records that are entered. (Excluding records with odd birth number when race of father and/or mother is coded 3 (Indian). Information to the right of the word "odd" is information contained in the first 80 positions of the record.)

(5) ALL DUPLICATE records are printed out. The information to the right of the word "duplicate" is the data contained in the first 80 positions of the record.

(6) The records with impossible birth numbers that were entered. The information to the right of the word "impossible" is the information contained in the first 80 positions of the record.

(7) The last line for each county (END) also reflects the 100 percent total count.

SECTION X - PROCEDURES FOR CHECKLIST/DATA COUNT RECONCILIATION AND REJECT PROCESSING - continued

A. Checklist/Data Count Reconciliation - continued

1. For States Submitting Certificates Numbered Behind County Targets - continued

The allowable tolerance is a maximum difference of three (or less). If there is a difference of more than three between the checklist and data count totals, the difference must be reconciled. This will be accomplished as follows:

a. Locate the difference entry on the Data Analysis Listing.

b. Analyze the differences with the use of the Lot Control Record, checklist, and film in the following ways:

(1) Shortage of Data Records

(a) Verify accuracy of beginning/ending birth numbers and checklist count and compare verified information with printout on Table 3.

(b) Check Lot Control Record for void or missing/illegible records.

(c) Check other counties for records appearing in wrong county and transfer to county in which shortage appears. CAUTION - Make such transfers only after checking Lot Control Record to see if the record was filmed behind wrong county target and if this is noted on the Lot Control Record, the coder has made the correction. A notation should be made on the computer listing.

(d) Check microfilm file for any remaining records indicated as missing. If record is not in microfilm file, request copy of certificate from state office.

(2) Overage of Data Records

(a) Verify accuracy of beginning/ ending birth numbers and the checklist count and compare with printout on Table 3.

SECTION X - PROCEDURES FOR CHECKLIST/DATA COUNT RECONCILIATION AND REJECT PROCESSING - continued

A. Checklist/Data Count Reconciliation - continued

1. For States Submitting Certificates Numbered Behind County Targets - continued

b. (2) Overage of Data Records - continued

(b) Check the analysis listing for duplication of records. If duplicate(s) is found:

1. Check all printout information; if identical, delete duplicate(s).

2. If duplicate birth numbers but different records, check the film to determine the correct record or see if the same birth numberwas assigned to different records. It is often possible to identify the correct record and identify the remaining record(s) as one shown on the analysis listing as missing.

(c) If a record has been improperly included, delete it from the file. (See c.(2) below.)

c. Post the results of the analysis on Table 3.

d. Post the following differences to the Checklist and Data Tabulation Analysis Form (Illustration 4).

(1) Change in OCCURRENCE - For records that were incorrectly entered for county of OCCURRENCE. (See line 1.)

(2) Deletion - For records that need to be eliminated from the data file (duplications, etc.). (See line 2.) If multiple duplication occurs, establish the correct record by checking identifying items on film. Try to match the other record(s) with records listed as missing. Make a notation on the listing showning how the discrepancies have been resolved. A deletion entry will delete the first record of a duplication. If the second record is in error, it will be necessary to delete both records and add the correct record. (See (3) below.)

SECTION X - PROCEDURES FOR CHECKLIST/DATA COUNT RECONCILIATION AND REJECT PROCESSING - continued

A. Checklist/Data Count Reconciliation - continued

1. For States Submitting Certificates Numbered Behind County Targets - continued

d. (3) Addition - For records that were not included in the data file. (See line 3.) A reader-printer copy of the missing image must be made for all additions and attached to the Checklist and Data Tabulation Analysis Form.

e. "Prepare Tape From Checklist and Data Tabulation Analysis Form"

(1) Corrected place of occurrence - Make an entry for each line item in the form coded with a "1" in data position 1.

(2) Deletion - Make an entry for each line item posted on the form coded with a "2" in data position 1.

(3) Additions - A reader-printer copy of the missing record(s) or the correct record, in case of error, will be attached to the form. A record must be entered and verified 100 percent from this record according to the regular natality coding instructions except for data position 1. Data position 1 will always have a "3" entered to show additions.

2. For States Submitting Certificates Numbered Without County Targets

Once the basic data file shipment is processed, its contents are compared with the control information supplied by the state in order to establish a complete, unduplicated file for editing and tabulations. The comparison is made on the following elements:

a. Beginning and ending certificate numbers

b. Sequence check in the above range to identify

(1) duplicate birth numbers

(2) missing records

c. Records with birth numbers outside of the valid range defined by a. above.

SECTION X - PROCEDURES FOR CHECKLIST/DATA COUNT RECONCILIATION AND REJECT PROCESSING - continued

A. Checklist/Data Count Reconciliation - continued

2. For States Submitting Certificates Numbered Without County Targets - continued

Based on this comparison, the following messages are printed to facilitate the reconcilfation process:

"MISSING" cites the birth number (or range of numbers) of the missing record(s)

"DUPLICATE" cites the birth number(s) which is duplicated. (The data record is also printed out with the birth number to facilitate determination of whether the entire data record is duplicated or if the "duplicate" really represents different events with the same birth number.)

"EXTRA" cites the birth number (or range of numbers) of each extra record.

The printout also contains information on total file counts and numbers of "Missing," "Duplicate," and "Extra" records.

"MISSING": Check state transmittal form to see if record has been voided by state. If not, check microfilm file for record and make copy for addition to file. If record is not in microfilm file, request copy of certificate from state office.

"DUPLICATE": Check microfilm file to determine if the duplicate represents two different events. If not two different events, flag for deletion.

"EXTRA": All extra records should be deleted.

Update records should be processed using the format given in Section VIII. Special instructions are as follows:

Addition Records: Code and enter all records flagged for addition to the file. Data position one of program level 2 should be coded "3" to indicate an addition.

Deletion Records: For each record flagged on the listing for deletion, create a record containing a "2" in data position one (data year) of program level 2 to

SECTION X - PROCEDURES FOR CHECKLIST/DATA COUNT RECONCILIATION AND REJECT PROCESSING - continued

A. Checklist/Data Count Reconciliation - continued

2. For States Submitting Certificates Numbered Without County Targets - continued

a deletion. The only other information needed in the record is:

Program Level	Positions	Item
2	2-3	State
2	4-5	Shipment Number
3	1-6	Birth Number

NOTE: For duplicates on which one record of the set (two or more records with same ID and data) needs to be retained, it is necessary to first delete each member of the set using "deletion" records and then restore one record through use of an "addition" record.

B. Reject Processing

Birth data are edited on the mainframe computer to detect impossible and highly improbable codes. Replacement codes for fail edits in certain items are imputed automatically without reference to the source document. Records having fail edits on the occurrence, residence, and age of mother items are rejected from the birth file and are listed for reference to the source document to establish the proper code assignment. On this reject listing the records appear in the order of the original demographic records. For each record appearing on the reject list, a key entry operator must find the record on microfilm and code it in entirety regardless of whether the fail edit items were originally correct. The only exception is that records inadvertently introduced in the file may be rejected simply by not re-entering them. This process is verified 100 percent.

Seattle, Washington
St. Louis, Missouri
Washington, District of Columbia

APPENDIX C

INTERPRETATIONS OF ATLAS NOTATIONS

1. If the notation "part of ____" or "population included in ____" appears, consider the entry to be an inclusion of the city named and code accordingly.

2. If the notation "rural" and "mail to ____" or "no pop." appears, code to the balance of the county.

3. If only the notation "mail to ____" or "population included with ____" appears, code to the balance of the named county. ("Population included with" refers to an unincorporated place.)

4. If the notation "Station," "Branch of ____" or "Rural Station" appears, code to the balance of county.

5. If the notation "Station of ____ P. O." appears, consider the entry to be an inclusion of the city named and code accordingly.
